Message from Our CLSA President

Hello Central Valley Chapter. I hope this newsletter finds you well in these challenging times. 2020 was a difficult year for many of us, and 2021 has not started much better. The State of California relies on us, the land surveyors, to help keep our economy moving forward. Many of us are as busy as ever, while others have slowed down a bit. Whatever your situation, it is critical that we have you as a member of the California Land Surveyors Association (CLSA). Please reach out to others in our great profession and encourage them to join CLSA. Our great organization is more effective with increased membership. Do not limit your recruiting efforts only to other licensed professionals, but reach out to LSIT's, and even uncertificated technicians. Think how much better the work they do will be if they are understanding the critical decisions licensees make.

The [2021 Annual Conference](#) is coming up, and this one looks to be amazing. We are holding a virtual event again, building on the success of our 2020 conference. This year we are teaming up with six other states and offering a mix of Headliners with new material and speakers not yet or recently featured in a CLSA Conference. The dates are March 27th through 30th. If those dates don't work for you, register anyway and attend every session of the conference at your convenience for the rest of 2021.

Thank you for your participation in our great organization please help make 2021 huge success for CLSA.

Rob McMillan, CLSA State President

Monument Obituaries

By Mike Quartaroli, PLS

CLSA CENTRAL VALLEY CHAPTER

Survey Monument Conservation Committee
Tretheway Road, San Joaquin County
N 2241892'
E 6366594' (SPC - 3)

This survey monument was found wounded and abandoned in September 2020. A diligent search of its origin ended in failure. A brief search of any surviving siblings also ended in failure. If anyone has any information of the origin of this survey monument you are encouraged to contact Mike Quartaroli. This orphan has the potential of being rehabilitated. There may be numerous nearby easements along the Mokelumne River based on this survey monument.

Ask about the "Adopt A Monument" program. Make a lasting contribution to the Land Surveying Profession.

Paid for by the Survey Monument Conservation Committee

State News

Congratulations to our new Licensed Land Surveyors for the State of California. The following passed the state specific exam and qualified for licensure in October, 2020.

Successful Projects Start with CSDS

ABOUT CSDS:

Established in 1986, California Surveying & Drafting Supply Inc., a leading solutions provider serving architects, engineers, contractors, land surveyors and GIS professionals throughout California, is the largest provider of geospatial tools, technology and training in the western US, and is one of the top 5 largest dealers of Trimble products in the country. We are highly respected for our knowledge driven solutions for some of the largest businesses and government agencies throughout California, including CalTrans, PG&E, USDA and many others. Additionally, we are the top HP DesignJet reseller in the United States.

**CALIFORNIA SURVEYING
& DRAFTING SUPPLY**

559.275.0513

4753 W Jennifer Avenue, Fresno

www.csdsinc.com

WE OFFER:

INDUSTRY LEADING TECHNOLOGY

From GPS receivers, robotic total stations and 3D scanners, to mapping & GIS systems, construction layout and wide-format printers, we have it all.

FACTORY TRAINED & AUTHORIZED SERVICE

As a Trimble Level 3 Service Center, you can rest assured your survey and GPS systems will always be repaired to factory specifications and returned to you in a timely fashion. Same or next-day field service is also available for all HP, Seiko and Context wide-format printers and scanners.

EQUIPMENT RENTALS

A complete line of survey and construction rentals is available on a daily, weekly or monthly basis.

REAL-TIME NETWORK (RTN)

CSDS operates California's largest RTN, providing precision positioning with one-centimeter accuracy for surveying, mapping, engineering, forensics and agricultural applications.

SUPPLIES

We stock and provide free local same/next-day delivery of supplies including lath, flagging, paint, tape measures, survey markers and more.

National News

How geospatial technology boosts efforts to restore degraded land and create new forests

By John Stenmark, PS

Imagine planting enough new trees to cover a plot of land the size of Switzerland. Now do it again and again, nearly 500 times, until you've covered two billion hectares. It's a huge, seemingly overwhelming effort. Yet a Dutch company is using advanced geospatial technologies to make it happen.

From its base in Amsterdam, Land Life Company works to restore lands degraded by natural or human activities such as wildfire, desertification, agriculture and urbanization. It's one of a small handful of companies capable of large-scale tree planting services needed to reestablish forests and create productive landscapes.

With projects in 25 countries on five continents, Land Life clients include governments and corporations seeking to reinvigorate damaged land and soils or to offset carbon released by commercial activities. Since its founding in 2013, Land Life has planted nearly 1.3 million trees.

Successful tree planting comes in bunches. At each project location, new trees are planted in groups to provide protection against the wind. The young trees spread naturally to fill in and enlarge the new forest. Eventually the soil improves to support new plant life and further aid in carbon capture.

But it's difficult to plant trees successfully on a large scale and Land Life plants trees by the thousands. Logistics are complex and costs for sapling trees, supplies, labor and equipment add up quickly. To optimize the cost-to-benefit ratio, Land Life needs to achieve a high rate of success for the trees it plants; the young trees need to grow and remain healthy in order to produce the long-term benefits.

SURVEY POSITIONS AVAILABLE IN MODESTO

O'Dell Engineering has several Survey positions available in their Modesto office. For more information go to <https://odellengineering.com/profile/employment/>

TRANSPORTATION SURVEYOR - (CALTRANS) DEPARTMENT OF TRANSPORTATION

Department of Transportation (San Joaquin County), is currently recruiting for a Transportation Surveyor position (\$5,406.00-\$10,377.00 per month). Some of the duties include, but are not limited to: Analyzes field survey data, prepares Survey Requests and compiles supporting information for field surveys. Produces maps and documents, including legal descriptions, acquisition deeds, appraisal maps

San Joaquin County - Final filing Date: Until Filled

For further information, refer to the duty statement in the CalCareer link below.

PROFESSIONAL LAND SURVEYOR

Benchmark Engineering, Inc. has an opening for a Professional Land Surveyor. This position will supervise the preparation of boundaries, maps, legal descriptions, A.L.T.A.'s, construction staking, field set-up, and other survey related efforts. Performs project management; project quality control; and develops/promotes business relationships. Includes working with and overseeing survey technicians and field crews. Capable of strong organizational skills. PLS is required. AutoCAD Civil 3D experience necessary.

Send Resume to: Michelle Cooper mcooper@bmeng.net

915 17th Street, Modesto, CA 95354 (209) 548-9300

How geospatial technology boosts efforts to restore degraded land... *continued from [page 6](#)*

Data-driven Forests

To reach and maintain success, Land Life monitors the new trees through periodic visits to measure parameters such as height and health. Combined with information on the tree species, location, soils and environmental conditions, the data supports informed decisions in planning the next round of planting and enables Land Life to adjust variables such as soil amendments and watering approaches.

“We are gathering as much data as we can,” says Tom Janmaat, a data scientist at Land Life. “We’re shaving costs in the operations and using our knowledge to optimize performance. The next steps will be ecological gains: making sure that you plant the right trees in the right spot at the right time. Scientific knowledge is available and we think we can get even better. We can help improve our knowledge base by gathering data on how our trees grow: Learning what works and what doesn’t.”

Janmaat explained that Land Life records as much data as possible on factors that could influence the trees’ growth and survival rates, then analyzes how the various parameters influence each other. Thanks to its rigorous statistical practices, Land Life needs to monitor only a fraction of its trees. On a planting of a hundred thousand trees, they typically monitor a few thousand to produce a good sample of every combination of tree species and treatments in a given field.

Monitoring tree performance is a labor-intensive process. To control costs, the company is working to improve productivity in its monitoring efforts. For example, it developed an in-house smartphone app to guide users through the capture of information on a tree’s species, height and health. In order for the information to be useful, field teams must be sure that they visit the same tree every time. When dealing with thousands of nearly-identical trees, it’s not a simple task. That’s where GNSS comes in.

For years, Land Life attached small paper tags with unique QR codes to the trees selected for monitoring. While the codes ensured accurate identification of specific trees, they required the monitoring personnel to carry a separate QR reader and crawl on the ground to reach and scan the tag. The method was further compromised by the fact that some QR tags were torn off and lost each year. So, Land Life turned to satellite positioning using the GPS receivers built into the team members’ smart phones. That decision led to a new challenge: accuracy.

In open fields and with access to a cellular network, a smartphone’s built-in GPS can provide positions accurate to roughly three meters. The accuracy is worse when working in treed areas or locations where cellular signals are not available—conditions where Land Life does much of its work. With trees spaced three to four meters apart, the smartphone GPS can’t provide the accuracy needed to confidently identify and return to the same tree repeatedly. Land Life needed the ability to measure to within one meter.

Accurate Positioning Produces Accurate Information

Professional-grade GPS or GNSS (Global Navigation Satellite System) receivers could easily meet the sub-meter requirements, but Land Life was concerned about the cost and complexity of those solutions. They had already invested in writing software for data collection and their field teams were familiar and efficient with those in-house apps. Land Life needed a way to blend higher accuracy positioning into their existing workflows and Bring-Your-Own-Device (BYOD) approach to locating and monitoring the trees.

Land Life selected the Trimble R1 GNSS receiver, a device roughly the size of a pack of playing cards that can provide real-time positioning with sub-meter accuracy. Using a Bluetooth connection, the R1 can stream position data to apps running on iOS or Android smartphones, making it easy for field workers to carry and use. Land Life software developers incorporated the high-accuracy positions into their in-house monitoring apps. With the position data in their familiar apps, workers could use existing workflows and smartphones; they needed very little training on the new device.

Land Life can also mount a R1 onto its tree planting machines, enabling field teams to capture the location of each new tree when it is planted. For monitoring, the app can then guide users to specific trees. “When you have that sub-meter accuracy flowing from the R1, it’s easy to find your way back to a tree,” Janmaat said. “You walk towards the tree, you look on your phone and say, ‘Oh, yeah. I see the dot of my location on my screen next to the tree that I’m looking for.’ It works quite well.”

Building on its experience with the R1, Land Life is also using Trimble Catalyst, which combines a small GNSS antenna with software running on an Android-based tablet or smartphone. By turning the smartphone into a GNSS system that can produce up to centimeter accuracy, the Catalyst technology further reduces the cost and complexity of accurate positioning. Like the R1, the Catalyst solution uses GNSS correction data from the Trimble RTX service to produce the needed sub-meter positions; Catalyst functions as an all-in-one GNSS positioning service that can be subscribed to on a monthly or even hourly basis.
